Alectryon subdentatus (F.Muell. ex Benth.) Radlk.

- Radlkofer, L.A.T. in Jonkman, H.F. (ed.) (1879), Ueber die Sapindaceen Hollandisch-Indiens. *Actes du Congres International de Botanistes, d'Horticulteurs, de Negociantes et de Fabricants de Produits du Regne Vegetal, tenu a Amsterdam, en 1877* : 117

S.T.Reynolds

Shrub or small tree to 7 m. Branchlets and peduncles densely or thinly villous. Leaf rachis 1.5-4 cm long; leaflets 2-4 pairs, occasionally 1, elliptic or elliptic-obovate, broadly obtuse or subacute, serrulate, denticulate, or subentire, oblique, acute, obtuse or truncate at base, 0.7-9.5 cm long, 0.5-3.5 cm wide, puberulent to glabrescent, lower surface subglaucous; petiolule 1-2 mm long; petiole 0.2-2 cm long. Panicles to 6 cm long, few-branched. Male flowers not seen. Females 1.5-3.5 mm diam.; pedicels 1-2 mm long. Calyx 0.7-2.2 mm long, broadly shortly 5-lobed, pubescent. Petals absent. Fruit sessile, obscurely 2-lobed, transversely ellipsoidal, or 1-lobed, subglobose, 0.8-1.2 cm long, 1.4-2 cm diam., turgid; pericarp drying hard and ±woody, velvety outside. Aril granular.

Distribution: Occurs from south-eastern Qld to Gloucester, N.S.W.

Habitat: Found in dry rainforest, usually on foothills and steep, rocky slopes.

Notes: The species is close to *Alectryon tomentosus* in having leaflets in accrescent pairs with serrulate or entire margins; it differs in its velvety 2-lobed or indistinctly lobed fruits and thick pericarp. Two fairly close forms have been recognised. Since publication of the *Flora of Australia* the *Australian Plant Census* no longer recognises f. *subdentatus* for Qld.
