***Angophora woodsiana* F.M.Bailey**

- Bailey, F.M. (1881), On the flora of Stradbroke Island, with a description of new species. *Proceedings of the Linnean Society of New South Wales* 6(1) : 143-145

G.M.Chippendale

Tree to 20 m. Bark fibrous, grey to grey-brown throughout. Adult leaves petiolate, lanceolate to narrowly ovate, often falcate, acute to acuminate, attenuate at base; lamina entire, 9–15 cm long, 1.7–3 cm wide, glabrous, green above; lateral veins faint, at 60°–80°; petiole slightly flattened or terete, 10–17 mm long. Umbels 3- or 7-flowered; peduncle terete to quadrangular, 15–35 mm long, glabrous or pubescent with hairs and bristle-glands; pedicels terete, 15–25 mm long, pubescent. Hypanthium 4–10 mm long, 5–10 mm wide, pubescent. Sepals 5, 3 mm long. Petals 3–4 mm long, c. 4 mm wide. Filaments to 7 mm long; gland brown, distinct. Fruits ovoid or cylindrical, 11–15 mm long, 10–15 mm wide, glabrous or slightly pubescent, rarely rough with bristle-gland bases, prominently ribbed, black to grey.

Distribution: Occurs from Tin Can Bay, Qld, S to Coffs Harbour, N.S.W.

Common Name: Smudgee

Habitat: Grows in gravelly and sandy soil on sandstone hillsides in dry sclerophyll forest.

Representative Herbarium Specimens: Qld: N of Brisbane–Beerburrum, Feb. 1913, *S.Jennings* (FRI); N of Helidon, *L.A.S.Johnson* 7074A & *B.G.Briggs* (FRI, NSW). N.S.W.: 16 km N of Ramornie, *W.F.Blakely* & *D.W.C.Shiress* NSW 143494 (NSW); 1.6 km NW OF Busbys Flat, *L.A.S.Johnson* & *E.F.Constable* NSW 143493 (NSW).

Notes: Distinguished from *A. costata* by the rough bark, wide leaves on long petiole and strongly ribbed larger fruits. Pedicels much longer and fruits larger than those of *A. floribunda*. The trees are a good source of pollen, but not high in nectar, and honey produced is not first grade.

Illustrations: Illustrations: C.N.Debenham, *Austral. Pl.* 1: 21 (1961).
